

Business Insights Report – Marketing Campaign EDA

SkillCraft Technology – Task4

For this task, I analysed a marketing campaign dataset to understand how different campaigns and marketing channels performed. First, I cleaned the data by checking for missing values, duplicate records and incorrect data types. After cleaning the data, I used charts to understand campaign performance and the overall marketing funnel.

The dataset contains information about campaigns, channels, impressions, clicks, engagement, conversion rate and ROI. From the analysis, I observed that a large number of people viewed the campaigns, but only a smaller portion clicked on them and finally converted. This shows that there is a drop at different stages of the marketing funnel, so improving the conversion stage can help increase the overall results.

I also compared the ROI of different marketing channels. The ROI values of Facebook, Website and Instagram were quite close to each other, with Facebook showing a slightly higher average ROI in the analysis. However, the difference between the channels was small, so the budget should not be shifted completely to only one channel.

Overall, the analysis shows that Facebook can be given slightly more focus, while Website and Instagram can continue to be used as supporting channels. Instead of increasing the budget blindly, campaign performance should be monitored regularly based on clicks, conversions and ROI. Improving the conversion rate and targeting the right audience can also help in getting better results from the existing marketing budget.

Conclusion

This EDA helped me understand how data can be used to compare marketing campaigns and make simple business decisions. The main learning from this task was that looking at ROI alone is not enough; clicks, engagement and conversions should also be considered before deciding where to spend more budget.
